About our recording function, now the functionalities are :

Pros:
1. User can record multi channel simultaneously. Now we don't have limitation,   For example, user can watch BBC1 and record BBC2, BBC3, BBC at the same time.

2. User can set record timer for future event, server will record on time no matter STB is power on or power off when time is up.

3. User can record the past events as well. (catch-up   events)

4. The Capacity of each user's Record time is 40Hours.

Cons:
1. User can only record entire EPG event, User cannot decide when to start/stop. No matter when user starts to record, server will record the current event completely. For example, if current event is from 9:00-10:00, and user start to record at 9:30, server will still record 9:00-10:00.

Notes:
1. if there are recording events under processing, in the Top-right corner of full screen, user will see a Red Circle with Numeric inside, the Numeric represents current record tasks. The Numeric doesn't include the schedule record tasks.
